

1)

Join Ordering:

1) EMP → site 2

[cost = 300]

Site 2 computes ASG' = EMP ⋈ ASG

ASG' → site 3

[cost = 500]

Site 3 computes ASG' ⋈ PROJ

[Total cost = 800]

2) ASG → site 1

[cost = 400]

Site 1 computes ASG' = EMP ⋈ ASG

ASG' → Site 3

[cost = 500]

Site 3 computes ASG' ⋈ PROJ

[Total cost = 900]

3) ASG → site 3

[cost = 400]

Site 3 computes ASG' = ASG ⋈ PROJ

ASG' → site 1

[cost = 400]

Site 1 computes ASG' ⋈ EMP

[Total cost = 800]

4)  $\text{PROJ} \rightarrow \text{site 2}$  [cost = 500]

Site 2 computes  $\text{ASG}' = \text{PROJ} \bowtie \text{ASG}$

$\text{ASG}' \rightarrow \text{site 1}$  [cost = 400]

Site 1 computes  $\text{ASG}' \bowtie \text{EMP}$  [Total cost = 900]

5)  $\text{EMP} \rightarrow \text{site 2}$  [cost = 300]

$\text{PROJ} \rightarrow \text{site 2}$  [cost = 500]

Site 2 computes  $\text{EMP} \bowtie \text{PROJ} \bowtie \text{ASG}$  [Total cost = 800]

6)  $\text{EMP} \rightarrow \text{site 3}$  [cost = 300]

$\text{ASG} \rightarrow \text{site 3}$  [cost = 400]

Site 3 computes  $\text{EMP} \bowtie \text{PROJ} \bowtie \text{ASG}$  [Total cost = 700]

Since method 6 has the smallest communication time (700), it becomes the optimal join program with minimum response time and the result is stored in site 3.

2)

Part 1: Consider Site-1 and Site-2

As we know  $\text{EMP} \bowtie_{\text{ENO}} \text{ASG} = (\text{EMP} \bowtie_{\text{ENO}} \text{ASG}) \bowtie_{\text{ENO}} \text{ASG}$

$$1) \text{ASG}' = \pi_{\text{ENO}}(\text{ASG})$$

$$2) \text{ASG}' \rightarrow \text{Site 1}$$

$$3) \text{Site 1 computes } \text{EMP}' = \text{EMP} \bowtie_{\text{ENO}} \text{ASG}'$$

$$4) \text{EMP}' \rightarrow \text{site 2}$$

$$5) \text{Site 2 computes } \text{ASG}'' = \text{EMP}' \bowtie_{\text{ENO}} \text{ASG}$$

Part 2: Consider Site-2 and Site-3

As we know  $\text{PROJ} \bowtie_{\text{PNO}} \text{ASG}''' = (\text{PROJ} \bowtie_{\text{PNO}} \text{ASG}'') \bowtie_{\text{PNO}} \text{ASG}'''$

$$1) \text{ASG}''' = \pi_{\text{PNO}}(\text{PROJ})$$

$$2) \text{ASG}''' \rightarrow \text{site 3}$$

$$3) \text{Site 3 computes } \text{PROJ}' = \text{PROJ} \bowtie_{\text{PNO}} \text{ASG}'''$$

$$4) \text{PROJ}' \rightarrow \text{site 2}$$

$$5) \text{Site 2 computes } \text{PROJ}' \bowtie_{\text{PNO}} \text{ASG}'''$$

3) i) First we perform  $ASG \bowtie PROJ$  because we get a smaller intermediate result. The join result size of  $ASG \bowtie PROJ$  is 2000 which is smaller than the size of  $EMP \bowtie ASG$  which is 3000.

ii) Since the complete  $PROJ$  table is in site 3 we send it to site 2.

- i)  $PROJ$  (site 3)  $\rightarrow$  site 2 ( $\text{cost} = 2000$ )  $\nearrow \text{size of } PROJ$
- ii) Site 2 computes  $ASG' = ASG \bowtie PROJ$

iii) The intermediate result which is  $ASG \bowtie PROJ$  is stored at site 2 whose size is 2000.

Because the  $EMP$  is fragmented at different sites we need to bring it to site 2 for the second join.

- i)  $EMP$  (site 1)  $\rightarrow$  site 2 ( $\text{cost} = 2000$ )  $\nearrow \text{EMP Fragment at site 1}$
- ii)  $EMP$  (site 3)  $\rightarrow$  site 2 ( $\text{cost} = 2000$ )  $\nearrow \text{EMP Fragment at site 3}$
- iii)  $EMP$  is unioned at site 2  
 $EMP = EMP(\text{site 1}) \cup EMP(\text{site 2}) \cup EMP(\text{site 3})$
- iv) Site 2 computes  $EMP \bowtie ASG' = EMP \bowtie ASG \bowtie PROJ$

Hence, the result is stored at site 2.

The below are all steps together.

Step 1: PROJ(site<sub>3</sub>) → site<sub>2</sub> (cost = 2000)

Step 2: site<sub>2</sub> computes ASG' = ASG ⋈ PROJ

Step 3: EMP(site<sub>1</sub>) → site<sub>2</sub> (cost = 2000)

Step 4: EMP(site<sub>3</sub>) → site<sub>2</sub> (cost = 2000)

Step 5: EMP = EMP(site<sub>1</sub>) ∪ EMP(site<sub>2</sub>) ∪ EMP(site<sub>3</sub>)

Step 6: site<sub>2</sub> computes EMP ⋈ ASG' ⇒ EMP ⋈ ASG ⋈ PROJ

(Total cost = 6000)

4) 1) Conflicting Operations Pairs:

H1: w<sub>2</sub>(x) w<sub>1</sub>(x)

w<sub>2</sub>(x) R<sub>3</sub>(x)

w<sub>2</sub>(x) R<sub>1</sub>(x)

w<sub>1</sub>(x) R<sub>3</sub>(x)

w<sub>1</sub>(x) R<sub>2</sub>(x)

w<sub>2</sub>(y) R<sub>3</sub>(y)

H2: R<sub>3</sub>(y) w<sub>2</sub>(y)

w<sub>1</sub>(x) R<sub>3</sub>(x)

w<sub>1</sub>(x) w<sub>2</sub>(x)

R<sub>3</sub>(x) w<sub>2</sub>(x)

w<sub>2</sub>(x) R<sub>1</sub>(x)

H3: w<sub>2</sub>(x) R<sub>1</sub>(x)

w<sub>2</sub>(x) R<sub>3</sub>(x)

w<sub>2</sub>(x) w<sub>1</sub>(x)

w<sub>2</sub>(y) R<sub>3</sub>(y)

R<sub>3</sub>(x) w<sub>1</sub>(x)

H4: w<sub>2</sub>(x) w<sub>1</sub>(x)

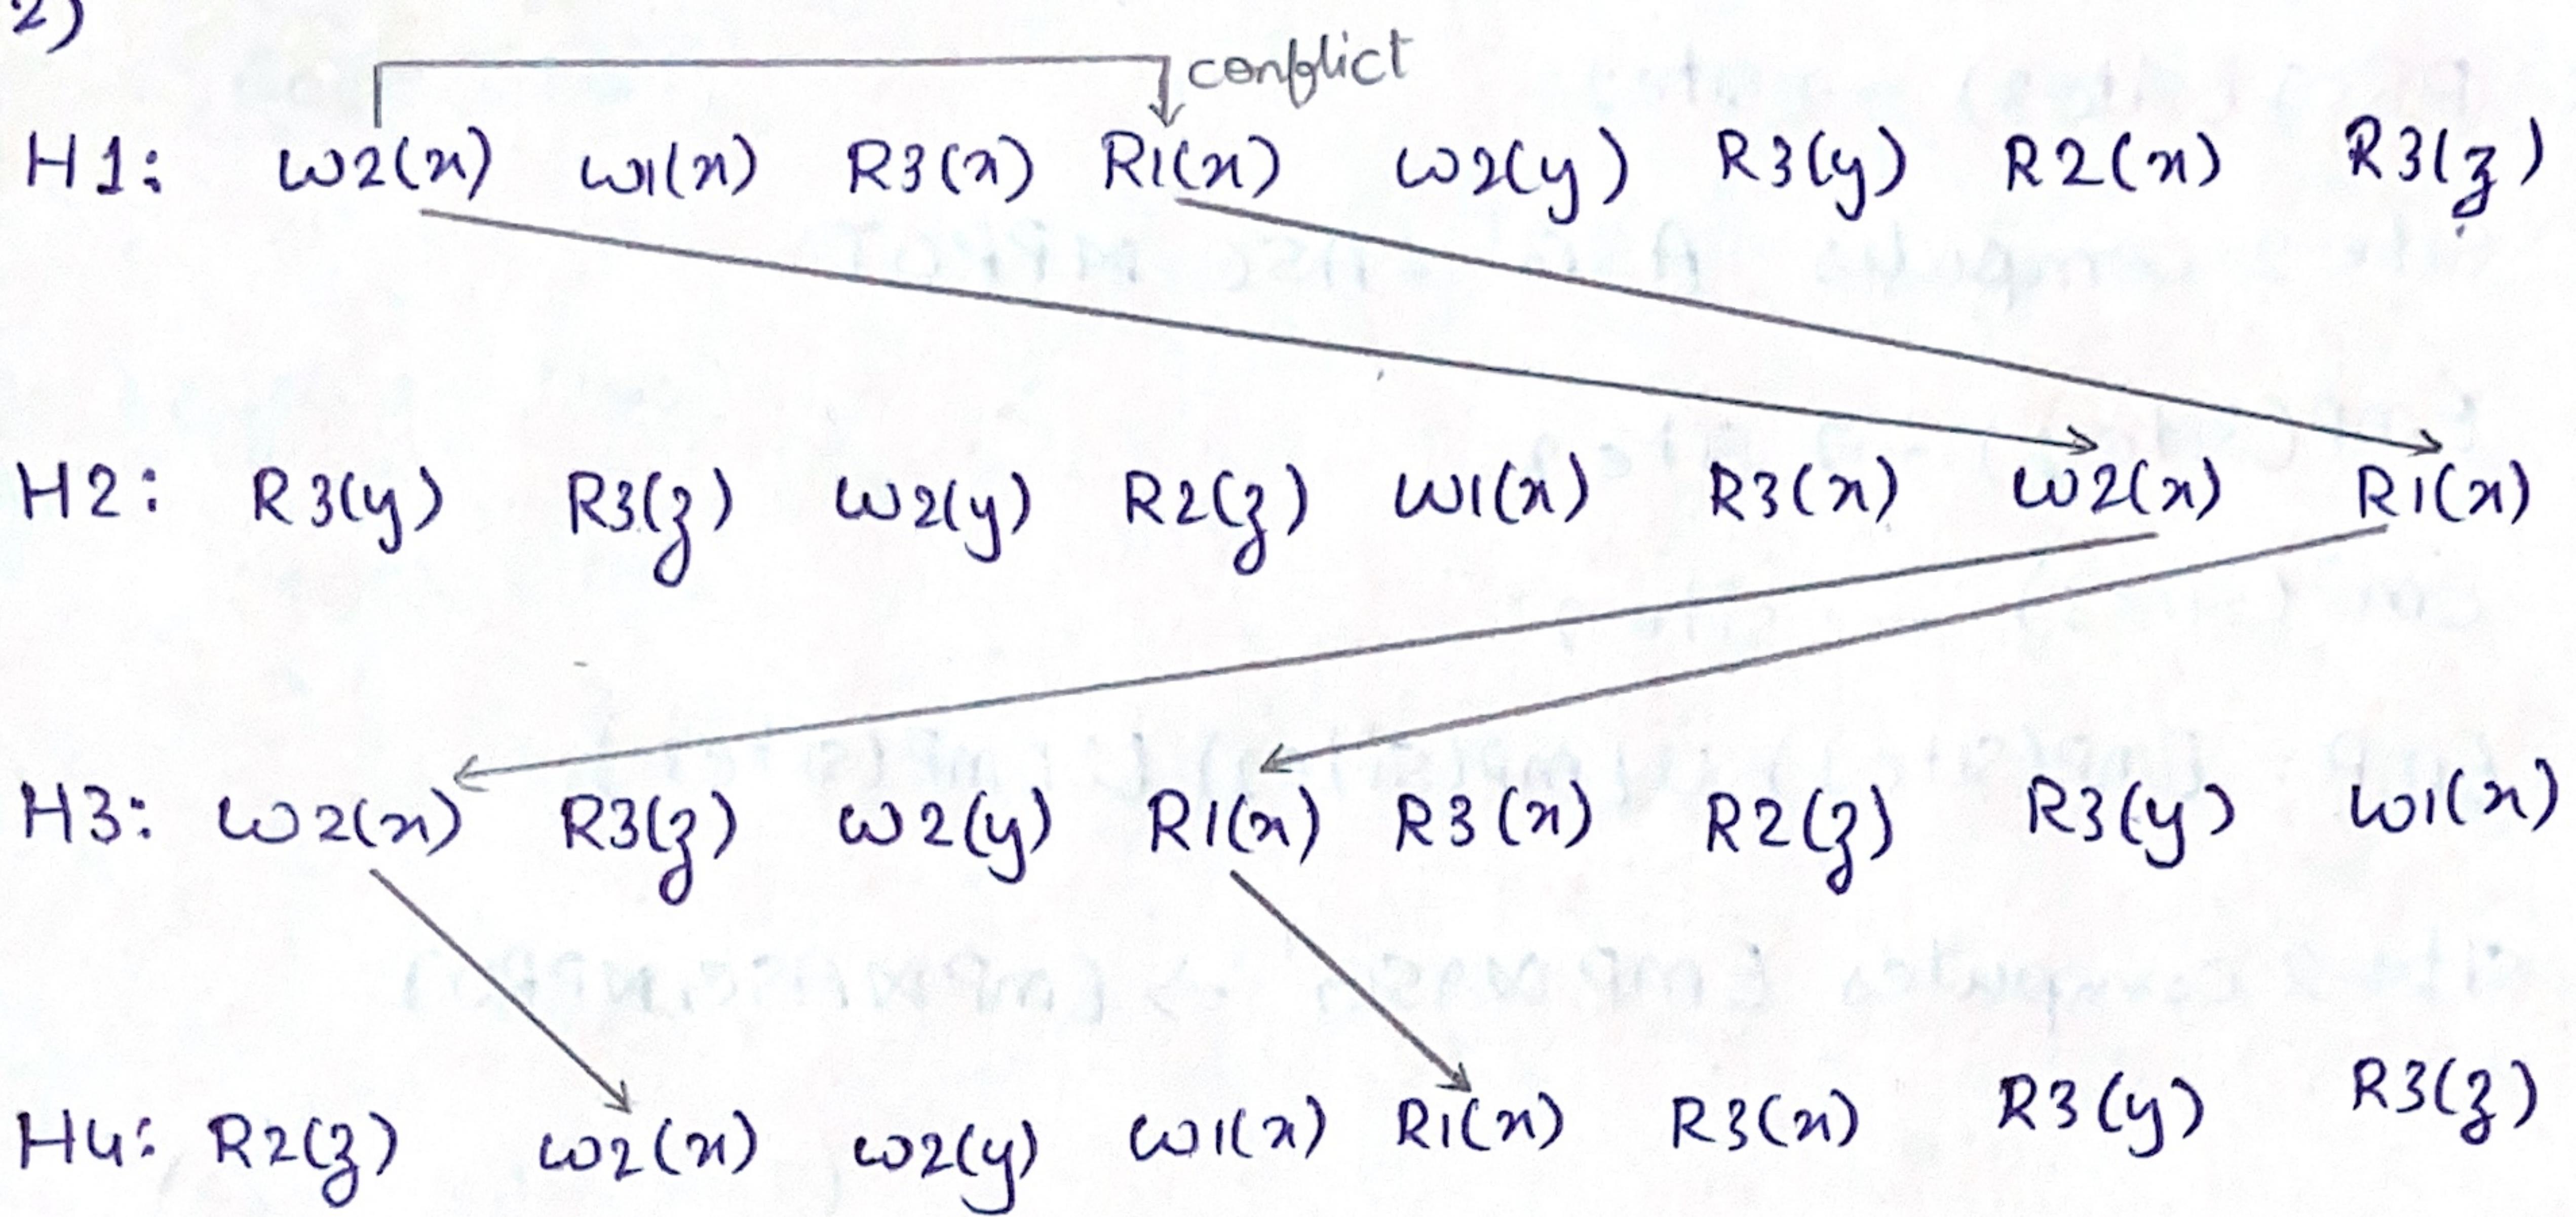

w<sub>2</sub>(x) R<sub>1</sub>(x)

w<sub>2</sub>(x) R<sub>3</sub>(x)

w<sub>2</sub>(y) R<sub>3</sub>(y)

w<sub>1</sub>(x) R<sub>3</sub>(x)

2)

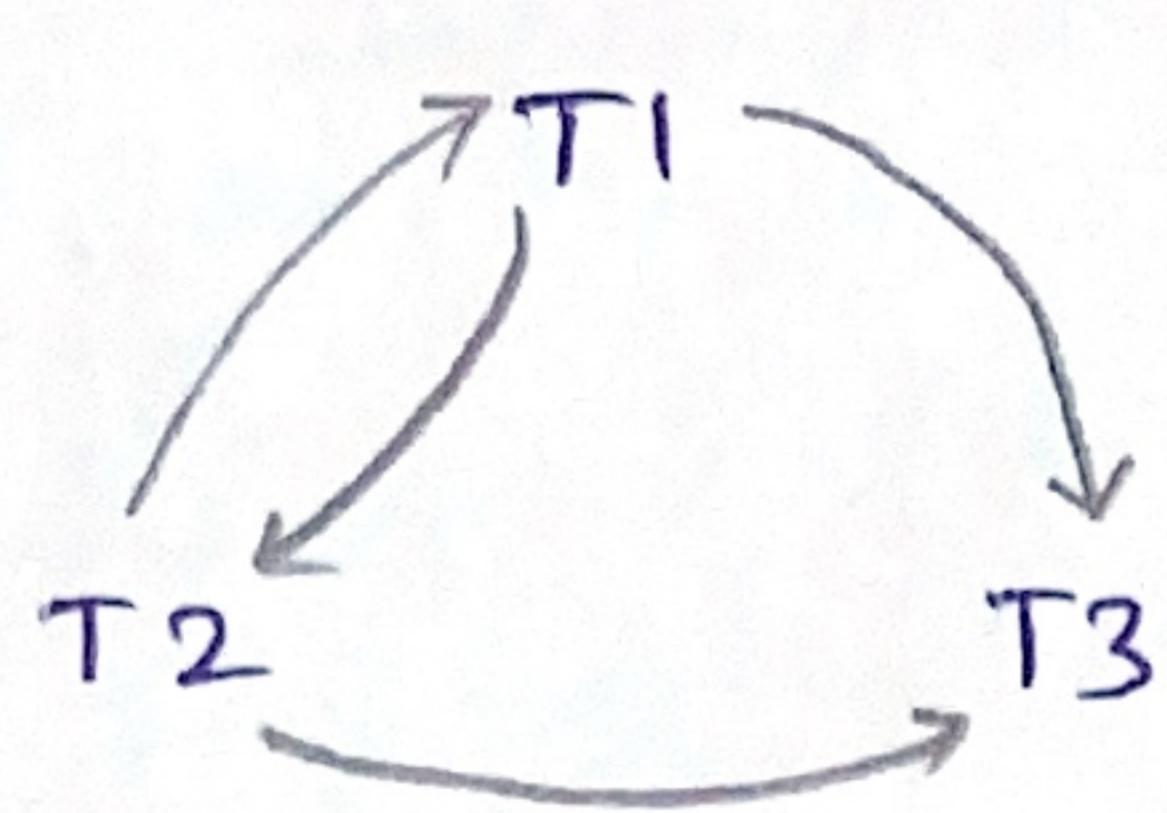

$w_2(x)$  and  $R_1(x)$  is a conflict Equivalence because it has the same set of conflicting operations in same order.

$w_2(x), R_1(x)$  appear in same order in all histories.

5)

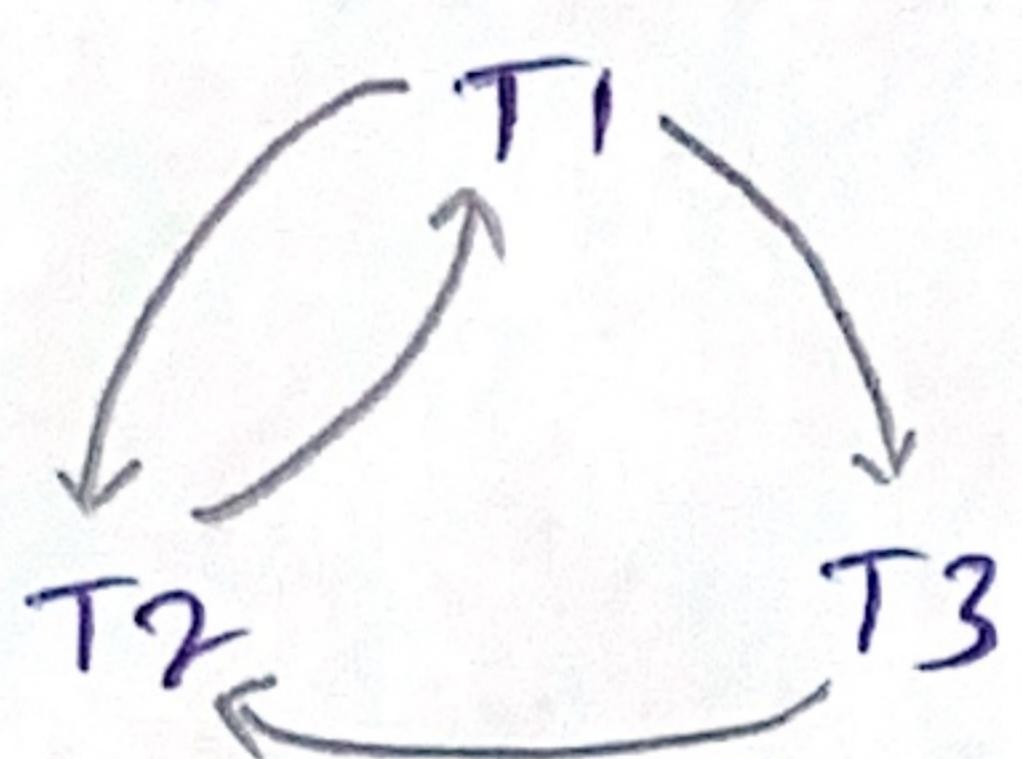

## Serialization graphs:

✗ H1:

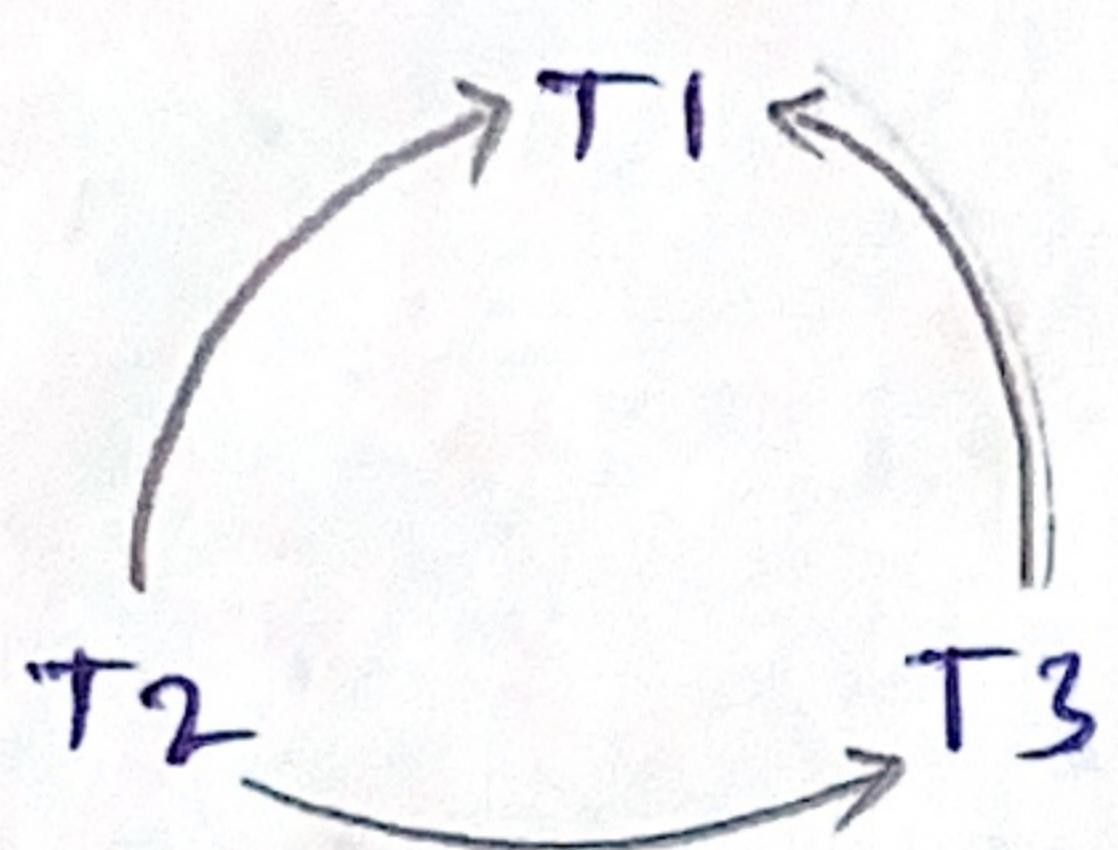

Because the serialization graph contains a cycle/loop  
H1 is not serializable.

✗ H2:

Because the serialization graph contains cycle  
H2 is not serializable

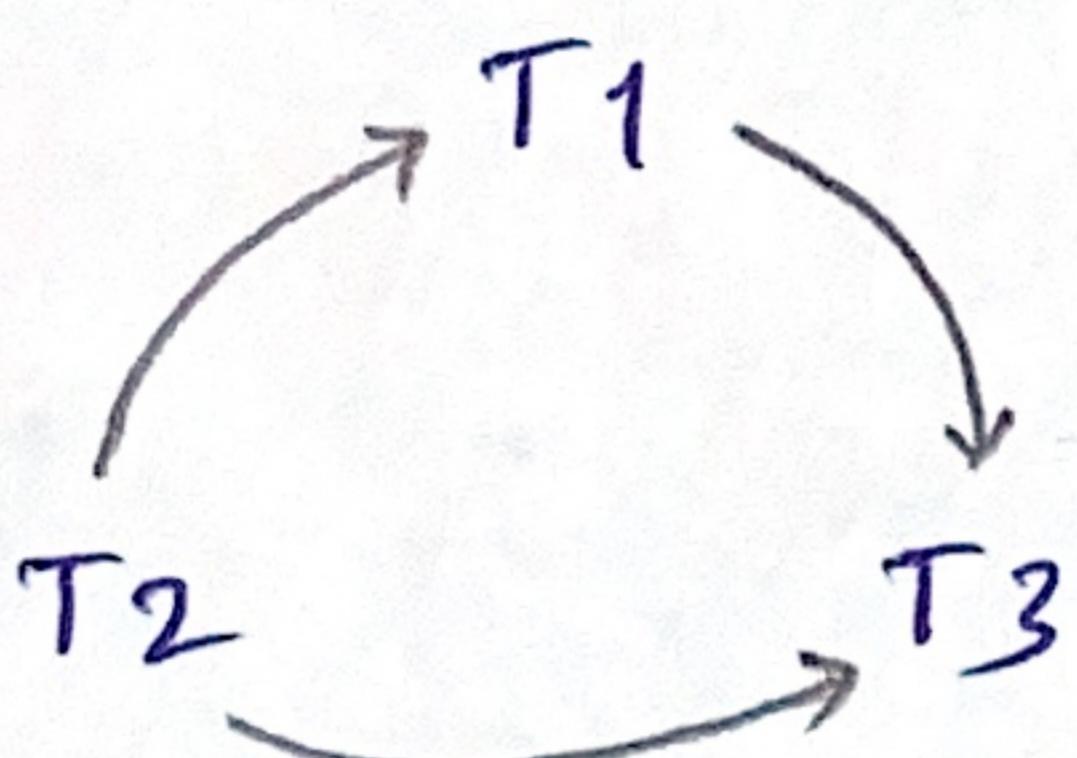

✓ H3:

Because the serialization graph do not contain any cycle, H3 is serializable.

The order of execution is  
 $T_2 \rightarrow T_3 \rightarrow T_1$  using in-degree's

✓ H4:

Because the serialization graph do not contain any cycle, H4 is serializable.

The order of execution is

$T_2 \rightarrow T_1 \rightarrow T_3$ .

H1 & H2 are not serializable because it contains cycle.

H3 & H4 are serializable because it do not contains cycle.
